Executive Summary

The West Virginia Board of Education (WVBE) is required to "institute a system for the coordination and delivery of high-quality professional development," (W. Va. Code §18-2I-1), including defining goals and standards for professional development (PD), and roles and responsibilities for state and regional PD providers. Accordingly, the board is required to establish an annual master plan for professional development (PD Master Plan) in public schools across the state, to include the "state board-approved plans for professional development by the State Department of Education, the Center for Professional Development, the state institutions of higher education and the regional educational service agencies to meet the professional development goals of the state board" (W. Va. Code §18-2I-4). The WVBE is also required to establish processes for evaluating the "effectiveness, efficiency, and impact of the statewide professional development plan" and submit its report to the Legislative Oversight Commission on Education Accountability" (W. Va. Code §18-2I-4). As in previous years, the board charged the West Virginia Department of Education's (WVDE) Office of Assessment and Research with the responsibility of conducting the evaluation.

In response to these requirements, the goals of this evaluation are to study the effectiveness, efficiency, and impact of the statewide PD Master Plan by investigating seven questions:

With regard to effectiveness,

- EQ1. What was the level of implementation for the PD Master Plan, overall and by individual providers?
- EQ2. What were the impediments, if any, to its full implementation?
- EQ3. To what extent did providers' offerings reflect the WVBE Standards for Professional Learning?
- EQ4. To what extent did providers' offerings reflect research-based PD practices? With regard to efficiency,
 - EQ5. To what extent did providers collaborate in the delivery of PD, thereby reducing duplicative efforts?

With regard to impact,

- EQ6. How well did providers' offerings address the WVBE's 2013-2014 Goals for Professional Learning?
- EQ7. What was the impact of the PD offered through the 2013-2014 PD Master Plan on educators' knowledge, practice, and attitudes?

Methods

Population studied

The unit of analysis for this study was the individual provider required by W. Va. Code §18-2I to participate in the PD Master Plan. This provider group included the following organizations and agencies: The WVDE, Center for Professional Development (CPD), the public institutions of higher education (IHE), and the regional educational service agencies (RESAs).

Research design

To investigate the seven evaluation questions, we collected data from providers in the form of *session reports*, which required providers to report for each session they conducted such information as the alignment of the session with the seven state Board Standards for Professional Learning; the beginning and ending dates, the duration and attendance for the session, its format and county location; and e-mail addresses for participants. The reporting year was divided into four collection periods: July 1 through October 31, 2014; November 1, 2014 through January 31, 2015; February 1 through April 30, 2015; and May 1 through June 30, 2015. E-mail addresses submitted during the first three data collection periods were used in a *survey of participants* conducted in two parts, with one random sample of unique participants surveyed in November/December 2014 and a second sample in May/June 2015. It should be noted that participants in PD that took place during the fourth data collection period (May 1–June 30, 2014) were not surveyed because of the difficulties involved in collecting data from educators during the summer months.

In addition to the session reports and the participant survey data, extant documents were used, especially WVBE policies, in order to put certain aspects of the study into context.

Findings

During the course of the 2014-2015 reporting year, 1,132 provider reports were completed, and 3,578 usable participant survey responses were received from a sample of 12,299, representing a 29.1% response rate, which was much lower than in previous years, when rates tended to range from 63% to 66%. The low response rate was due largely to the transition to a statewide Outlook Exchange system for email to the large majority of staff at schools, districts, and the WVDE during the first round of surveys, which led to major impediments during the first half of the survey data collection.

Major findings for 2014–2015 include the following, arranged here by effectiveness, efficiency, and impact:

Effectiveness of the PD Master Plan

The PD Master Plan included slightly fewer topics in 2014-2015 (434) than the previous year (479) and at 32,530 participants, attendance declined slightly overall compared with the previous year (33,196) This decline was due to lower participation for CPD, RESAs, and WVDE; however, with the addition of three more IHEs for this year, attendance more than doubled at IHE-provided sessions to 1,545 participants.

The PD Master Plan was implemented at levels comparable to previous years: overall 81% of sessions planned were delivered during the year.

Regarding the effectiveness of providers in meeting the Board Standards for Professional Learning, overall, the standards that providers most often believed they had met were Standards 3 (Requires prioritizing, monitoring, and coordinating resources for educator learning), 5 (Integrates theories, research, and models of human learning into learning designs to achieve its intended outcomes), and 7 (Aligns its outcomes with educator performance and student curriculum standards). The two standards providers least often reported meeting were Standards 4 (Uses a variety of sources and types of student, educator, and system data to plan, assess, and evaluate professional learning) and 2 (Requires skillful leadership to develop capacity, advocate, and create support systems for professional learning).

Regarding the extent to which providers' offerings reflected five research-based PD l development practices, overall, according to the participant survey active learning was the research-based PD practice least often present, followed by sufficient duration/timespan. In both cases, RESAs and the WVDE scored the lowest in their use of these research-based practices. Content focus was most often present, with IHEs topping the list in their use of this practice.

Providers' session reports seemed to confirm the findings about duration and timespan above. Of the 32,530 attendees reported by providers, about 20% (approximately 6,500) participated in PD lasting at least 30 hours; another 10% (approximately 3,250) had from 14 to 29 contact hours—durations shown by research to be the minimum needed to change teacher practice and impact student learning. The remaining 70% of participants attended sessions ranging from 1 to 13 hours.

Efficiency of the PD Master Plan

The Legislature's call for decentralization of PD seems to be reflected in the trends for the four major providers in the PD Master Plan, with the WVDE decreasing its number of offerings and participants from the previous year. RESAs and CPD held fairly steady, while IHEs increased the number of institutions participating from two to five, and doubled the number of participants in IHE-sponsored sessions. Still, the WVDE continued to report the greatest number of both sessions planned and participants in attendance.

The providers who exercised the greatest degree of collaboration were located in the WVDE, with CPD coming in second. Looking at individual providers, the top nine were in the WVDE.

Impact of the Master Plan

While all four of the Board's Goals for Professional Learning received coverage, Goal 2 was the focus of about 72% of sessions and 60% of attendees.

The participant surveys showed a high level of general agreement that the sessions they attended had been helpful in meeting the goals with which they were aligned for the first three goals—that is, 83% found the session helpful for Goal 1 (increase the knowledge and skills of all pre-K educators to deliver a comprehensive preK—third grade approach to early

childhood education that includes a balanced approach to early literacy; 71% for Goal 2 (increase deep content knowledge and proficiency in designing and delivering standards-driven instruction and assessments for all preK-12 West Virginia educators); 79% for Goal 3 (improve leadership competencies for principals and assistant principals in order to support high quality teaching and learningo. On the other hand, only 57% of participants in Goal 4-aligned sessions found them helpful in advancing toward that goal (support the full implementation of the revised educator evaluation system).

According to responses to retrospective pre- and posttest items in the participants' survey, the PD had large effects on educators' knowledge of the PD topic, and moderate effects on their practice and their attitudes/beliefs.

Limitations of the Study

The response rate for the participant survey, 29.1%, was far lower than in previous years, when rates tended to range from 63% to 66%. The low response rate was due largely to the transition to a statewide Outlook Exchange system for email to the large majority of staff at schools, districts, and the WVDE during the first round of surveys, which led to two major impediments. First, many recipients had not fully transitioned to the new system so some were using their former email addresses instead of the new ones. Second, the server settings for Outlook considered email from SurveyMonkey—the system we used to send invitations and record the responses online to be spam, so messages were blocked.

The participant survey conducted in November-December 2014 and May-June 2015 asked respondents to recall PD sessions they had participated in at some point in the past. In some cases, the sessions had taken place up to five months prior to the survey. For this reason, there is a possibility of temporal bias in survey participants' responses.

The use of a retrospective pre- and posttest methodology to assess changes in knowledge, behavior and skills, and attitudes and beliefs poses some concerns.

Recommendations

Based on these findings, we make the following recommendations.

In keeping with the Board Standards for Professional Learning,

- Increase the use of a variety of sources and types of student, educator, and system data to plan, assess, and evaluate professional learning, and
- Increase the focus on skillful leadership to develop capacity, advocate, and create support systems for professional learning.

With regard to the use of research-based PD practices,

- Increase the use of active learning during PD sessions, and
- Provide sufficient duration (30 or more hours) and timespan (weeks or months) to allow participants opportunities to apply what they are learning.

Based on factors present in the larger context of PD in the state, we recommend that the WVBE and WVDE

- Promote the Board's Standards for Professional Learning at the school and district level, so they will better guide educators' planning.
- Consider adoption of a model or standard for PD providers that aligns with and supports local learning communities working to adopt the Board's Standards for Professional Learning.

Introduction

In 2013, the legislation was signed into law requiring broad reforms resulting, in part, from the Governor's Education Efficiency Audit of West Virginia's Primary and Secondary Education System (Public Works, 2012). This report urged decentralization of the state's public education system, with more authority and responsibility transferring back to regional education service agencies (RESAs), districts, and schools. At the same time, the Legislature recognized the need for "clear state-level leadership for professional development for all West Virginia public school educators and administrators" (W. Va. Code §18-2I-1). Accordingly, it continued the requirement that the West Virginia Board of Education (WVBE) "institute a system for the coordination and delivery of high-quality professional development," (W. Va. Code §18-2I-1), including defining goals and standards for professional development (PD), and roles and responsibilities for state and regional PD providers. The WVBE was required to establish an annual master plan for professional development to be provided to public school educators across the state. The Master Plan for Statewide Professional Development (PD Master Plan) must include the "state board-approved plans for professional development by the State Department of Education, the Center for Professional Development, the public institutions of higher education [with teacher education programs] and the regional educational service agencies to meet the professional development goals of the state board" (W. Va. Code §18-2I-4).

The state board is also required to establish processes for evaluating the "effectiveness, efficiency, and impact of the statewide professional development plan" and "to submit its report to the Legislative Oversight Commission on Education Accountability" (W. Va. Code §18-2I-4). As in the previous three years, the West Virginia Department of Education's (WVDE) Office of Assessment and Research was charged with the responsibility to conduct the evaluation.¹

Components of the PD Master Plan

The PD Master Plan includes a definition, standards, and goals for professional learning, as well as a slate of session titles to be offered during the year.

Definition

In 2012, the WVBE adopted the following definition:

Professional development includes sustained experiences that lead to the development of knowledge, skills, practices, and dispositions educators need to help students perform at higher levels and achieve college and career readiness.

¹ The WVDE underwent reorganization during the course of this study. The Research unit is now housed in the Division of Technology's Office of Research, Accountability, and Data Governance.

Standards

That same year, the WVBE adopted the Learning Forward Standards for Professional Learning, paraphrased in the PD Master Plan as follows:

Professional learning that increases educator effectiveness and results for all students—

- Occurs within learning communities committed to continuous improvement, collective responsibility, and goal alignment.
- Requires skillful leadership to develop capacity, advocate, and create support systems for professional learning.
- Requires prioritizing, monitoring, and coordinating resources for educator learning.
- Uses a variety of sources and types of student, educator, and system data to plan, assess, and evaluate professional learning.
- Integrates theories, research, and models of human learning into learning designs to achieve its intended outcomes.
- Applies research on change and sustains support for implementation of professional learning for long-term change.
- Aligns its outcomes with educator performance and student curriculum standards. (Learning Forward, n.d.; WVBE, 2014).

Because these standards are meant to guide professional learning in schools and districts at the local level—in alignment with the legislative education reform—they present a challenge to state and regional providers who must align their offerings with them.

Goals

The Board Goals for Professional Learning reflect the priorities for the state education system, which in 2014-2015 was in its first year of full implementation of the Next Generation State Standards and the new teacher evaluation system. Thus, the goals were to

- 1. Increase the knowledge and skills of all pre-K educators to deliver a comprehensive preK-third grade approach to early childhood education that includes a balanced approach to early literacy.
- 2. Increase deep content knowledge and proficiency in designing and delivering standards-driven instruction and assessments for all preK-12 West Virginia educators.
- 3. Improve leadership competencies for principals and assistant principals in order to support high quality teaching and learning.
- 4. Support the full implementation of the revised educator evaluation system.

Sessions

The PD Master Plan for 2014-2015 also included a slate of 434 session topics aligned with the goals, which were planned and implemented by the four major provider groups—the Center for Professional Development, the state's institutions of higher education, regional education service agencies, and the WVDE.

Goals of the Evaluation

The goals of this evaluation are to study the effectiveness, efficiency, and impact of the statewide PD Master Plan by investigating seven questions:

With regard to effectiveness,

- EQ1. What was the level of implementation for the PD Master Plan, overall and by individual providers?
- EQ2. What were the impediments, if any, to its full implementation?
- EQ3. To what extent did providers' offerings reflect the WVBE Standards for Professional Learning?
- EQ4. To what extent did providers' offerings reflect research-based professional development practices?

With regard to efficiency,

EQ5. To what extent did providers collaborate in the delivery of professional development, thereby reducing duplicative efforts?

With regard to impact,

- EQ6. How well did providers' offerings address the WVBE's 2014-2015 Goals for Professional Learning?
- EQ7. What was the impact of the professional development offered through the 2014-2015 PD Master Plan on educators' knowledge, practice, and attitudes?

Relevant Scholarship

The Learning Forward Standards for Professional Learning, which were adopted by the WVBE were developed based on a comprehensive study conducted by a team of researchers from Stanford University led by Linda Darling-Hammond, with contributions and support from 40 professional associations. Working together, the standards make up components of a system for professional learning, which to be effective "most often occurs in learning communities; is supported by strong leadership and appropriate resources; is drawn from and measured by data on students, educators, and systems; applies appropriate designs for learning; has substantive implementation support; and focuses on student and educator outcomes" (Mizell, Hord, Killion, & Hirsh, 2011, p. 13). The Standards for Professional Learning, in other words, outline the context (learning communities, leadership, and resources), educator learning processes (data, learning designs, and implementation), and content (outcomes) needed for professional learning to result in improved practice and student outcomes.

A literature review (Hammer, 2013) revealed both contextual and quality issues to be considered in facilitating professional learning experiences for teachers and administrators. Context matters, in that, professional development that is not supported by multiple components making up a system of support will likely have minimal impact on educators and students. Based on their studies in mathematics education and the broader education research literature, Cobb and Jackson (2011, p. 12) outlined a system that includes multiple elements, all working together:

- Explicit goals for students' learning
- A detailed vision of high-quality instruction that specifies particular instructional practices that will lead to students' attainment of the learning goals
- Instructional materials and associated tools designed to support teachers' development of these practices
- District teacher professional development that focuses on the specific practices, is organized around the above materials, and is sustained over time
- School-based professional learning communities that provide ongoing opportunities for teachers to discuss, rehearse, and adapt the practices that have been introduced in district professional development
- Classroom assessments aligned with the goals for students' learning that can inform
 the ongoing improvement of instruction and the identification of students who are
 currently struggling
- Additional supports for struggling students to enable them to succeed in mainstream classes.

The literature review also revealed a widespread consensus about specific qualities of effective professional development—qualities that fit well with the fourth and fifth bullet items above and also aligned with the Learning Forward standards focused on *educator learning processes* (data, learning designs, and implementation), and *content* (outcomes). Within this context, research has shown that effective professional development tends to have the following elements:

- Content and content pedagogy focus. This element includes both deepening teachers' knowledge of the subject matter they are teaching and the pedagogical approaches that have been shown to be successful in helping students learn that subject matter. Effectiveness is improved if the PD uses the curriculum materials that teachers will later use with their students (Blank, de las Alas, & Smith, 2008; Carpenter et al., 1989; Clewell et al., 2004; Cohen & Hill, 1998, 2001; Desimone, Porter, Garet, Yoon, & Birman, 2002; Desimone, Smith, & Phillips, 2013; Doppelt et al., 2009; Garet et al., 2001; Kennedy, 1998; McCutchen et al., 2002; Penuel, Fishman, Yagamuchi, & Gallagher, 2007; Yoon et al., 2007).
- Coherence. This element involves providing PD experiences in a progression that builds on previous experiences and aligns with school goals and with state standards, curriculum, and assessments. Coherent professional development programs encourage continuing professional communication among teachers, either in their own school or with others in the district who teach similar subject matter or students (Cohen & Hill, 1998; Desimone et al., 2002; Garet et al., 2001; Grant, Peterson, & Shojgreen-Downer, 1996; Lieberman & McLaughlin, 1992).
- Active learning. Opportunities for active learning can include reviewing student data and work, practicing a new skill and obtaining feedback, planning how new curriculum materials and new teaching methods will be used in the classroom, and engaging in discussions and in written work (Desimone et al., 2002; Garet et al., 2001; Penuel, Fishman, Yagamuchi, & Gallagher, 2007).

- Collective participation. Professional development that has collective participation of teachers from the same school, department, or grade helps increase opportunities to discuss concepts, skills, and problems that arise when teachers work to integrate what they have learned into their classroom practice. Over time, it can lead to a professional culture—or learning communities—in which teachers in a school develop a common understanding of instructional goals, methods, problems, and solutions—an understanding that is sustained over time, even when some teachers leave and others join the group (Desimone et al., 2002; Desimone, Smith, & Ueno, 2006; Garet, et al., 2001; Johnson, Kahle, & Fargo, 2007; Penuel, Fishman, Yagamuchi, & Gallagher, 2007; Saunders, Goldenberg, & Gallimore, 2009).
- Duration, including time span and contact hours. Depending on the complexity and difficulty of the knowledge and skills teachers are learning, the number of contact hours may vary, but research suggests that at least 30 hours are needed to impact student achievement. Sustaining the experience over one or more school years is also important, allowing for more opportunity for teachers to try out new practices and benefit from additional feedback and communication with trainers, coaches, or colleagues in professional learning communities in their schools (Blank, de las Alas, & Smith, 2008; Clewell et al., 2004; Yoon et al., 2007).

This evaluation focuses on these qualities in its measures of effectiveness because of their support of the Learning Forward standards, and their relevance to the realm of influence within which statewide and regional providers work.

Methods

To investigate the seven evaluation questions, we collected data from providers in the form of *session reports*, which required providers to report for each session they conducted, the alignment of the session with the seven West Virginia Board of Education (WVBE) Standards for Professional Learning, the beginning and ending dates, the duration and attendance for the session, its format and county location, and email addresses for participants. Reporting followed the schedule shown in Table 1 below.

E-mail addresses submitted during the first three data collection periods were used in a survey of participants conducted in two parts, with one random sample of unique participants surveyed in November/December 2014 and a second group in May/June 2015. Participants in professional development that took place during the fourth collection period (May 1–June 30, 2014) were not surveyed because of the difficulties involved in collecting data from educators during the summer months.

In addition to the session reports and the participant survey data, extant documents were used, especially WVBE policies, in order to put certain aspects of the study into context.

Table 1. Provider reporting schedule						
Data collection period 1	July 1, 2014–October 31, 2014 (Deadline, November 7, 2014)	Reports sessions that began and ended during this time period				
Data collection period 2	November 1, 2014–January 31, 2015 (Deadline, February 6, 2014)	Report sessions that began anytime since July 1, 2014 and ended during the second data collection period				
Data collection period 3	February 1, 2014–April 30, 2015 (Deadline, May 7, 2015)	Reports sessions that began anytime since July 1, 2014 and ended during the third data collection period. Note: Sessions that began before April 1 and will end by May 15 should also be reported.				
Data collection period 4	May 1, 2015-June 30, 2015 (Deadline, July 7, 2015)	Provider reports for sessions that began and ended during this data collection period and for those overlooked earlier. No email addresses required.				

Population Characteristics

The unit of analysis for this study was the individual provider required by W. Va. Code §18-2I to participate in the PD Master Plan. In 2014–2015 this provider group included the following organizations and agencies:

- Center for Professional Development (CPD)
- Five of the required ten public institutions of higher education (IHEs) with teacher education programs
 - Fairmont State University
 - Marshall University (two programs participated separately, Clinical Experiences and Professional Development Schools and the June Harless Center)
 - West Virginia State University
 - West Virginia University
 - West Virginia University Parkersburg
- All eight regional education service agencies (RESAs)
- Eleven program offices in the West Virginia Department of Education (WVDE) that provide professional learning experiences to educators across the state, including
 - Schools for the Deaf and Blind
 - Office of Assessment and Research
 - Office of Career & Technical Instruction
 - Office of Early Learning
 - Office of Federal Programs
 - o Office of Institutional Educ. Programs
 - Office of Instructional Technology
 - Office of Professional Preparation
 - Office of School Improvement
 - Office of Secondary Learning
 - Office of Special Programs

To investigate the performance of these 25 organizations and agencies, we surveyed the participants in the PD sessions they offered to gain their views about the quality of their learning experiences. This population included, among others, district central office staff, school administrators, regular and special education teachers, instructional support teachers, school librarians/media specialists, and paraprofessionals.

Sampling Procedures

For both the first and second participant surveys, we applied multistage sampling—systematic, stratified, and simple random—to select participants for this study, using the following procedure:

- We combined the session participant e-mail addresses submitted in providers' session reports—each e-mail address with its associated PD Master Plan session ID and provider—into one comprehensive Excel file (N = 13,452 for the first participant survey; N = 11,958 for the second).
- In the second survey, email addresses that had been included in the first survey sample were removed.
- Participants were sorted by e-mail address and assigned a random number. The sample was then resorted by random number and the first occurrence of each individual's e-mail address was selected, resulting in 8,527 unique email addresses for the first data collection period and 7,541 for the second.
- The data were then stratified by provider. Knowing the population of each provider, the MaCorr Research Sample Size Calculator² was used to determine the sample size needed to be between a +/-5% confidence interval at the 95% confidence level. To that figure, an additional 50% was added when possible, to allow for attrition and lack of response. A simple random sample was then drawn for each provider. For some providers reporting lower numbers of session participants, the entire population of unique e-mail addresses was included in the sampling. After subtracting those that bounced back or opted out of the survey, a total of 12,105 unique e-mail invitations were sent.

Measures

To address the seven evaluation questions, different combinations of the two primary data sources described above and policy documents related to the CPD and RESAs were employed, as outlined in Table 2.

The online questionnaire used in the participant survey was similar to the one used in 2013–2013. The quality measure used was based on the findings of the literature review described in the Relevant Scholarship section above. Three questions were developed for each of five quality indicators—that is, content focus, coherence, active learning, collective participation, and duration/timespan—to form a Research-Based PD Practices Index (See Appendix A, page 29).

². Available online at http://www.macorr.com/sample-size-calculator.htm.

The online session report, which providers filled out to report each of the sessions they delivered, was similar to previous years. Policy and state code outlining the responsibilities of RESAs and CPD, used to understand contextual issues, especially with regard to collaboration, were accessed via the websites for the WVBE (http://wvde.state.wv.us/policies/) and the West Virginia State Legislature (http://www.legis.state.wv.us/wvcode/Code.cfm?chap=18&art=1).

Research Design

Descriptive statistics were employed for five of the seven evaluation questions above, that is, for EQ1 and EQ3-EQ6. For EQ2, a qualitative analysis was employed, which involved coding provider responses to a query asking for descriptions of the impediments they encountered that inhibited delivery of sessions for which no reports were received. For the final evaluation question (EQ7), significance testing (paired t tests) was used to determine statistical significance of differences between participants' self-assessments of their knowledge, practice, and attitudes/beliefs before (pre) and after (post) the professional development they attended (EQ7). Practical significance was studied using the Cohen's d statistic to determine the effect size of those pre and post measures. Also, we reviewed policy and state code requirements for various types of collaborations among the four major groups in the PD Master Plan to put findings into context.

Results

During the course of the 2014-2015 reporting year, 1,132 provider reports were completed, and 3,578 usable participant survey responses were received from a sample of 12,299, representing a 29.1% response rate, which was much lower than in previous years, when rates tended to range from 63% to 66% (Table B 1). The low response rate was due largely to the transition to a statewide Outlook Exchange system for email to the large majority of staff at schools, districts, and the West Virginia Department of Education (WVDE) during the first round of surveys, which led to two major impediments. First, many recipients had not fully transitioned to the new system so some were using their former email addresses instead of the new ones. Second, the server settings for Outlook considered email from SurveyMonkey—the system we used to send invitations and record the responses online—to be spam, so messages were blocked.

This level of response to the participant survey poses challenges with regard to reporting on some measures of effectiveness and impact in the participant survey for individual providers—especially those that submitted relatively few participant e-mail addresses—as confidence intervals are larger than 5% for 20 of the 25 providers at a 95% confidence level. For this reason, this report will not focus on individual provider results from the participant survey. At the provider *group* level, the confidence intervals at a 95% confidence level ranged from $\pm 2.2\%$ (regional education service agencies [RESAs]) to $\pm 6.0\%$ (institutions of higher education [IHE]). For more details, see Table B 1. Consequently participant survey results for IHEs must be viewed with some caution.

Effectiveness

EQ1. What was the level of implementation for the PD Master Plan, overall and by individual providers?

This question will be addressed in two parts, including the overall participation in developing and implementing the PD Master Plan including the percent of professional development offerings that were planned versus the ones delivered; and the level of participation in the *evaluation* of the PD Master Plan.

Implementation of the PD Master Plan

The number of providers rose to 25, primarily due to the higher participation of IHEs. Five other IHEs are required by W. Va. Code (§18-2I) to participate, but were not successfully recruited by WVDE to do so.

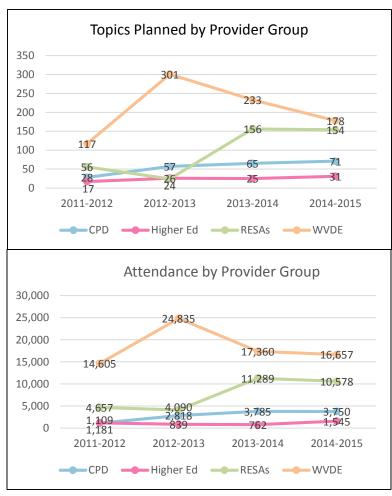

Figure 1. Trends in Participation of Provider Groups in the PD Master Plan, 2011–2012 through 2014–2015

Data source: PD Master Plan Session Report databases

Decentralization of the delivery of professional development-especially when comes to reducing the role of the WVDE as called for in education reform legislation—appears to be continuing (Figure 1). While the overall number of session topics submitted for the plan has risen strongly from 218 in 2011-2012, to 434 the 2014-2015, the number submitted by each of the four groups has shifted dramatically since 2012-2013, when the reform legislation passed, with the WVDE declining in both number of topics and number of participants for the past two years. The other four provider groups have increased their participation, most notably the RESAs, from 24 topics in 2012-2013 to 154 in 2014-2015. Yet, the WVDE remains the provider group with the most topics and most participants. The rise in RESA topics and participation may reflect, in part, a

decision by the directors to participate more fully in the PD Master Plan than they had in previous years, in addition to true increases in the PD they provide. In previous years, RESAs'

annual reports reflected far more activity than that indicated by their reporting for the PD Master Plan. In 2013-2014, however, RESAs received additional funding to bolster their staffing for professional development and were assigned more responsibility for it than was previously assigned to the WVDE. The dramatic increases in the number of topics RESAs submitted to the plan, from three topics per RESA (one aligned with each of the WVBE goals) to as many as 51 topics (RESA 1), likely did reflect to some extent increases in their professional development activities, as well as increased participation in the PD Master Plan. They have more or less held steady in the past two years.

Attendance declined slightly for CPD, RESAs, and WVDE; however, with the addition of three more IHEs for this year, attendance more than doubled at IHE-provided sessions (Figure 1).

Most professional development planned by providers in the PD Master Plan was later delivered and reported. In all, 434 session topics were approved for the PD Master Plan for 2014-2015; of those over 80.6% (350) were reported as delivered—a similar percent as in previous years. About half of the organizations in the PD Master Plan provided 90% or more of what they had planned. Three providers reported delivering less than half of what was in their plan, including the WVDE Office of Federal Programs (25.0%), Glenville State College (0%) and WVDE Office of Career and Technical Accountability and Support (0%) see Figure 2 below and Table B 2 (page 32).

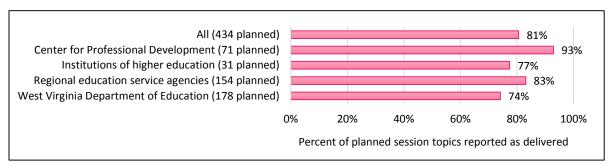

Figure 2. Percentage of Sessions Included in the PD Master Plan That Were Reported as Delivered by Provider Groups

Data Source: 2014-2015 PD Master Plan Session Report database

Implementation of the evaluation of the PD Master Plan

Participation in the PD Master Plan also includes participation in its evaluation, by submitting *session reports* online via a SurveyMonkey instrument. Providers may offer a topic listed for them in the PD Master Plan once or multiple times with different groups of individuals. Once a session is completed with a particular group of individuals including any follow-up, the provider submits a session report, which includes email addresses of participants. The submission of email addresses is central to our ability to contact participants and collect their impressions of their professional learning experiences via the participant survey.

Providers varied in their compliance with this aspect of participation in the PD Master Plan. Of the four major groups, the RESAs and CPD performed best, supplying 96.4% and 88.8% of their participants' email addresses, respectively. The WVDE supplied 80.6% and IHEs supplied about two thirds (68.7%). See Table B 3 (page 33) for details.

EQ2. What were the impediments, if any, to the full implementation of the PD Master Plan?

Each of the providers that had session titles in the plan for which no reports were received was offered the opportunity to provide explanations for why the sessions were not held or reported. For about a quarter of the topics not reported (n = 28), providers explained that the session actually was or would be provided, but on a different schedule (just before or just after the reporting year) or was delivered by other means or providers. Twenty other sessions were cancelled due to lack of interest or to unforeseen circumstances (n = 12). Another quarter of sessions were not reported with no explanation provided (n = 19) or were actually provided but not reported by staff (n = 6), amounting to reporting error. For a breakdown by provider see Table B 4 (page 34). Other summary details are available in Table B 5 (page36).

EQ3. To what extent did providers' offerings reflect the West Virginia State Board of Education (WVBE) Standards for Professional Learning?

As mentioned earlier, the Board is required in code to adopt standards for professional learning, which it did in 2012. The WVBE standards may best be viewed as standards to be met by individual schools and districts rather than by providers because, taken together, they make up a system for continuous school improvement in which all members of a school community have roles to play and decisions about professional development are based on students and teachers learning needs (see Relevant Scholarship, page 3). In such a system, providers may play a role, however, in delivering training on a topic or skill set educators have identified as being needed.

There was no practical way to learn from participants whether providers were aligning their offerings with all seven WVBE standards. We did, however, ask providers themselves which of the WVBE standards they had met for each of the sessions they reported. Results are shown in Table 3. While CPD claims to have met all standards for all sessions they offered, other providers were more circumspect in their assessments. Overall, the standards that providers most often believed they had met were Standards 3 (Requires prioritizing, monitoring, and coordinating resources for educator learning), 5 (Integrates theories, research, and models of human learning into learning designs to achieve its intended outcomes), and 7 (Aligns its outcomes with educator performance and student curriculum standards).

	All (ı	n = 1,132)	CPD	(n = 189)	IHE	s (n = 47)	RESA	s (n = 525)	WVDI	E (n = 371)
Board standard met	N	%	N	%	N	%	N	%	N	%
1. Learning communities	895	79.1	189	100.0	44	93.6	475	90.5	187	50.4
2. Leadership	789	6 9.7	189	100.0	38	80.9	413	78.7	149	40.2

4. Data	780	6 8.9	189	100.0	32	6 8.1	427	81.3	132	35.6
5. Learning designs	928	82.0	189	100.0	44	93.6	460	87.6	235	63.3
6. Implementation	810	71.6	189	100.0	38	80.9	422	80.4	161	43.4
7. Outcomes	914	80.7	189	100.0	35	74.5	442	84.2	248	6 6.8
Data source: 2014-2015 PD Master Plan Session Report database										

The two standards providers least often reported meeting were Standards 4 (Uses a variety of sources and types of student, educator, and system data to plan, assess, and evaluate professional learning) and 2 (Requires skillful leadership to develop capacity, advocate, and create support systems for professional learning).

EQ4. To what extent did providers' offerings reflect research-based practices?

The final measure of effectiveness used an index based on findings from a review of the research literature on effective professional development practices (Hammer, 2013; see Appendix A, page 29). The index was more focused on what providers can do—versus what school and district staff can do—to design and implement professional development experiences that have a collection of qualities shown to be associated with changes in teacher practice and improved student performance. The index is, therefore, well suited to eliciting participant reports about which of these qualities were present in the sessions they were asked to comment upon.

The usefulness of the index was limited for some role groups included in the survey sample, especially RESA staff, district central office staff, school administrators and a miscellaneous *other* category. Research on effective approaches to professional development is much scarcer for these role groups. The index, therefore, is based on the richer research base focused on teachers. Consequently there were some items in the index that were presented only to teachers. Table B 6 shows the percentages of respondents from teachers versus the administrator/other role group, who agreed or disagreed with each item or considered it not applicable. Due to this limitation, the following analyses will focus on teachers only. Other sections of the survey will allow us to examine the views of both teachers and non-teachers.

Response options included 1 (strongly disagree), 2 (disagree), 3 (agree), 4 (strongly agree), and not applicable. The index scores were based on the percentage of the 15 items that participants agreed or strongly agreed were present in the session they attended. Figure 3 gives the big-picture view of the providers' performance collectively with regard to the five research-based practices, as reported by teachers:

Content focus

Nine-tenths of teachers thought the sessions they attended had helped them deepen their content knowledge and content pedagogy. Further, about three quarters of them indicated the session had used the curriculum materials they would be using with their students.

Coherence

Teachers overwhelming thought the sessions they attended were in alignment with the school/district goals and with their own learning needs. About two thirds found the session to be new learning for them, and not going over ground that had been covered previously.

Active learning.

There appears to have been quite a lot of active learning, including discussions, reviewing student work, and opportunities to practice and receive feedback. However, one area that may need attention is allowing time for teachers to begin planning, while at the session,

for how they will put the new skills and ideas to work. Just over half of teachers indicated they had time for planning implementation.

Collective participation

Teachers seem to be attending sessions with their colleagues, for the most part. About three quarters of them agreed that the session motivated them to collaborate more and/or helped them develop common understandings and approaches.

Duration/timespan

Having enough contact hours and follow-up experiences during the school year was slightly less common, according to teachers. Only about two thirds thought they had enough experiences during the year to learn and develop the new skills. This perception is born out in a later portion of the report, which looks at duration and timespan as reported by providers' in their session reports.

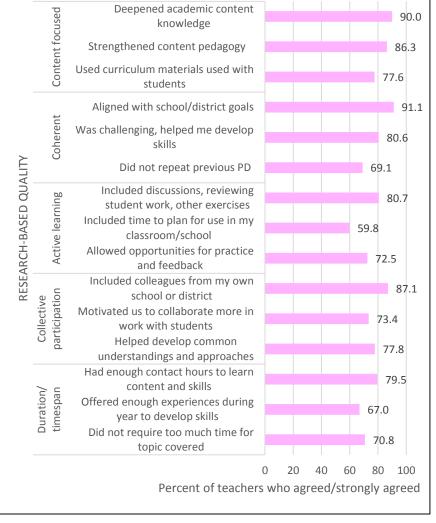

Figure 3. Rate of Agreement Among Teachers That Research-Basea Qualities Were Present in Session Attended

Note: There were 2,233 teachers who responded to the survey. Percentages were nearly identical to those shown when looking only at responses from teachers in sessions aligned with Goals 1 and 2. Data source: Teacher respondents to WVBE PD Master Plan Participant Survey 2014-2015

Focusing on differences among provider groups, this

time using the composite rates for each of the five qualities, active learning was the research-based PD practice least often present, followed by sufficient duration/timespan. In both cases, RESAs and WVDE scored the lowest, although only slightly (Figure 4). Content focus had the highest rate of agreement, with IHEs topping the list.

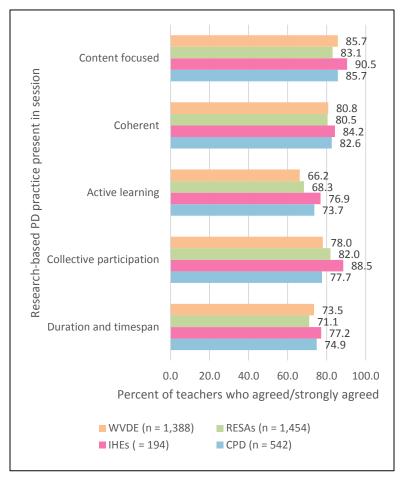

Figure 4. Percent of School-Based Respondents That Agreed or Strongly Agreed That Five Research-Based PD Practices Were Present in the Sessions They Attended by Provider Group

Data Source: School-based respondents to WVBE PD Master Plan Participant Survey 2014-2015

As mentioned earlier, the index used in the analyses described above was made up of 15 items, three for each of the five research-based PD practices. A more granular look at the survey results-that is, examining the results for each of the items in the Research-Based PD Practices Indexgives a few more clues about what each of the provider groups may want to look at in their own planning and conduct of professional learning experiences (Table 4).

The following are the highest- and lowest-scoring items in the survey among teacher respondents (Table 4).

Center for Professional Development

- Highest scores—90% or above—Deepened academic content knowledge; aligned with school/ district goals
- Lowest scores—Included time to plan for implementation in my classroom/school (60.5%);

offered enough experiences during school year to develop and apply skills (63.5%)

Institutions of higher education

- Highest scores—90% or above—Deepened academic content knowledge; aligned with school/district goals; included colleagues from my own school or district; strengthened content pedagogy
- Lowest scores—Did not require too much time for topic covered (72.3%); Did not repeat previous PD (70.1%)

Regional education service agencies

Highest scores—90% or above— Included colleagues from my own school or district; aligned with school/district goals

• Lowest scores—Did not repeat previous PD (68.2%); offered enough experiences during school year to develop and apply skills (63.3%); included time to plan for implementation in my classroom/school (54.7%)

West Virginia Department of Education

- Highest scores—Above 90%— Aligned with school/district goals
- Lowest scores—Did not require too much time for topic covered (69.7%); Did not repeat previous PD (69.5%); Included time to plan for implementation in my class-room/school (63.4%)

Table 4. Percent of Teachers That Agreed/Strongly Agreed the Session They Attended Met This Criteria, by Provider

·	Percent agreed/strongly agreed with this item						
	All	CPD	IHEs	RESAs	WVDE		
The professional development	(n = 2,233)	(n = 425)	(n = 137)	(n = 956)	(n = 715)

For one of the five research-based PD practices, duration/timespan, we also collected data from the providers. As part of their session reporting, providers indicated the duration of each session in hours. They also reported the beginning and ending dates, from which we were able to ascertain the timespan in days. As mentioned earlier, research has shown that at

least 30 hours of PD are needed to affect teacher practice and improve student learning. Additionally, when professional learning takes place over an extended period of time, there are more opportunities for participants to practice new skills, and follow-up with trainers and fellow participants as they encounter new challenges. Duration and timespan have separate effects.

Duration

Looking first at duration, the largest portion (45%) of the participants attended training lasting a half day up to about 2 days; the second most common duration category (26%) was informational sessions, lasting up to 4 hours. Only about 20% of attendees were in sessions lasting the recommended 30 hours or more (Figure 5).

The different provider groups varied considerably. About 31% of attendees at CPDled sessions and 28% at WVDEled sessions received 30 or more contact hours. Only 4% of attendees at RESA-led sessions received that number of contact hours (Figure 5), which serves to confirm the comparatively low ratings given to RESAs by respondents to the participant for duration survey and timespan (see Figure 4, page 15 and Table 4, page 16).

and Table 4, page 16).

Looking at individual providers, RESAs 4 and 5 had

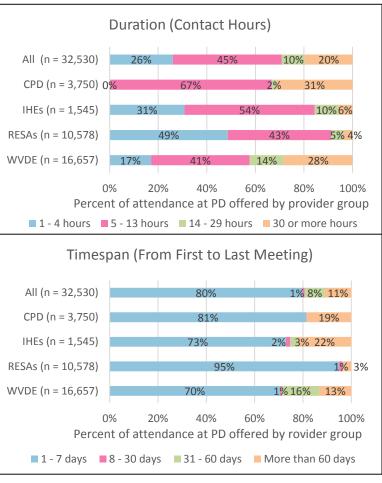

Figure 5. Distribution of Attendees Across Duration and Timespan Categories by Provider Group

Data Source: 2014-2015 PD Master Plan Session Report database

the highest percentages of participants in sessions lasting 30 or more hours, at 9% and 10% respectively; meanwhile, RESAs 1, 2, and 8 reported no sessions lasting that length of time. Among IHEs, only the June Harless Center at Marshall University reported sessions lasting 30 or more hours, at 16%. Almost a third of CPD's sessions lasted that long. Among WVDE providers, 81% of attendees at Office of Instructional Technology sessions received the recommended level of at least 30 hours of training, while 98% of the attendees at sessions provided by the Office of Institutional Education Programs received 4 or fewer contact hours and 80% of attendees at sessions offered by the Office of Professional Preparation received training of such short duration. For complete results by individual provider, see Figure B 1 (page 38).

Timespan

Turning now to timespan, measured here in the number of days that elapsed between the beginning date and the ending date of sessions, there is again considerable variation (Figure 5, page 17). Overall, 80% of all participants attended sessions that began and ended within one week.

The breakdown of the number of sessions in the PD Master Plan, number and percent delivered by provider group and individual provider is included in Figure B 2 (page 39). WVDE tended to have the greatest attendance at sessions with longer timespans, with about 39% of their participants attending sessions taking place over at least 31 days, including 13% attending sessions that spanned more than 60 days. Three offices account for this higher level of attendance at sessions with longer durations: The Office of Early Learning, with 60% of their attendees in sessions lasting more than 60 days, the Office of Instructional Technology, with 82% of their attendees in sessions last more than 30 days, and the Office of Professional Preparation with 65% of their attendees in sessions lasting 31–60 days. The remaining eight WVDE offices had 95% to 100% of their participants in sessions lasting a week or less.

Nearly all (95%) of RESA participants attended training that began and ended within one week or less. Among RESAs, RESAs 4 through 8 had at least some participants who were in sessions with the longest timespans (more than 60 days), although it was only 9% or less of their attendees.

About 19% of attendees at CPD events received PD that extended beyond a 60-day timespan. Most of the other received training that took place over a weeklong period or less.

IHEs tended to have participants in session that began and ended within a week or that took place over more than 60 days. The majority (56%) of West Virginia State University participants were in sessions that fell into that category. For complete results by individual provider, see Figure B 2 (page 39).

Efficiency

EQ5. To what extent did providers collaborate in the delivery of professional development?

One of the purposes of the PD Master Plan is to increase the efficiency of the statewide system of PD by reducing duplication of effort. We studied the issue of efficiency by looking at the number of collaborative partnerships providers in the PD Master Plan engaged in to conduct their sessions, assuming that collaboration is an antidote to siloed independent offerings. In this analysis we focused only on collaborations with other providers in the PD Master Plan. Partnerships with vendors, consultants, counties, and other state agencies are not included in this analysis.

Figure 6 shows, on average, the number of collaborators state providers had for each of their sessions. The providers who exercised the greatest degree of collaboration were located in the WVDE, with CPD coming in second. Looking at individual providers, the top nine were in the WVDE.

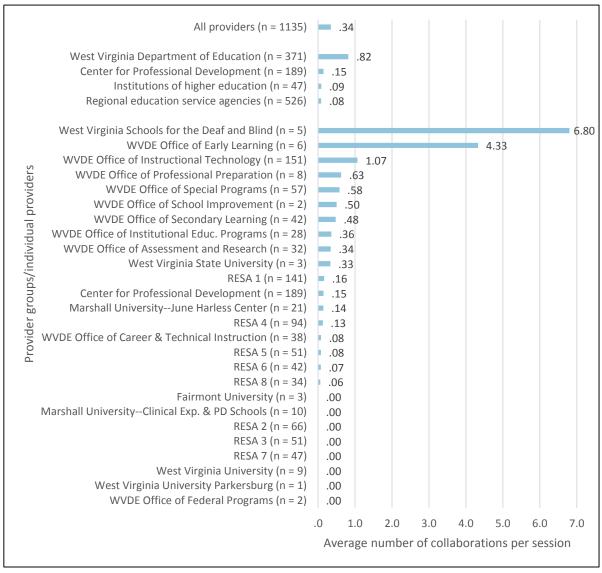

Figure 6 Average Number of Collaborations per Session by Provider

This graph shows the overall average number of collaboration per session (top bar), the averages for each of the provider groups (next four bars down), and the averages for each individual provider (remaining bars). Data source: 2014-2015 PD Master Plan Session Report database

Impact

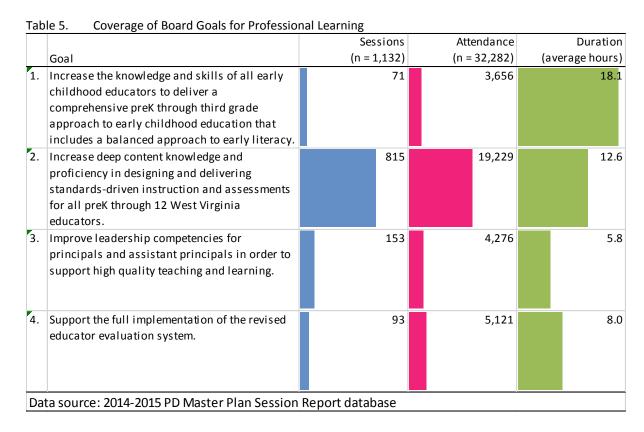

Impact will be examined by addressing the final two evaluation questions related to coverage of the West Virginia Board of Education (WVBE) goals and the participants' estimation of how their own knowledge, practice, and attitudes/beliefs were affected by the professional development session we asked them to respond to.

EQ6. How well did providers' offerings address the WVBE's 2013-2014 Goals for Professional Learning?

We will examine two dimensions to this question—how well the goals were covered by the providers, and participants' views about how helpful the PD was in meeting the Board's goals.

Proportion of PD offerings targeting each of the goals overall

About 72% of sessions (n = 815) were focused on Goal 2 and 60% of attendees (n = 19,229). Goal 2 sessions were among the longest in duration, second only to sessions focused on Goal 1. By comparison, sessions focused on Goals 3 and 4 had an average duration of about half or less the duration of sessions focused on Goals 1 and 2 (Table 5).

Participant reports of PD's helpfulness in meeting board goals

Participants were asked in four items if the session they had attended was helpful in meeting each of the four WVBE Goals for Professional Learning. Response options included 1 (not applicable), 2 (strongly disagree), 3 (disagree), 4 (agree), and 5 (strongly agree). The data in Figure 7 reflect only the responses of participants in sessions providers indicated were aligned with particular goals. So for example, if a participant attended a session that a provider said was aligned with Goal 1, only his/her response to the Goal 1 item was included in the analysis and his/her responses to the items for Goals 2-4 were ignored. Although ordinarily we would not include responses of "not applicable" when calculating percentages, we thought such a response to a session that providers' considered aligned to a particular goal was a form

of nonagreement that the session had been helpful in moving them toward that goal. Figure 7 shows a high level of general agreement for Goals 1–3—at least 71%—that the sessions they attended had been helpful. Just over half of respondents thought sessions they attended, which were intended by providers to target Goal 4 had, indeed, been helpful in preparing them to make effective use of the educator evaluation system.

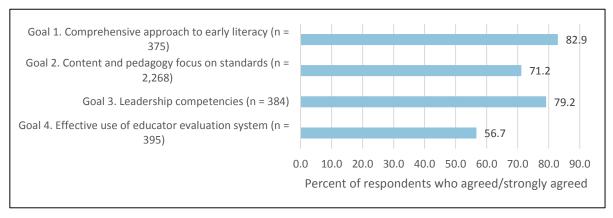

Figure 7. Percent of Respondents Who Agreed or Strongly Agreed That the Session Was Helpful in Meeting the Targeted Board Goal

Source: WVBE PD Master Plan Participant Survey 2014-2015

EQ7. What was the impact of the professional development offered through the 2014-2015 PD Master Plan on educators' knowledge, practice, and attitudes?

We used a retrospective pre-test and posttest design to assess the extent to which survey respondents perceived a change in their own knowledge, behaviors/practice, and beliefs/attitudes as a result of participating in professional development. The survey contained three pairs of items that asked respondents to use a 4-point Likert-type scale (i.e., o [not at all], 1 [to a small extent], 2 [to a moderate extent], 3 [to a great extent]), to rate the extent to which they agreed with statements about themselves both before and after having participated in the professional development session they attended. A fifth response category was included, but only used to allow respondents to indicate the item was not applicable to them. These responses were not used when calculating mean scores.

Pair 1. Before participating in this PD, to what extent were you knowledgeable about the topic it covered?

After participating in this PD, to what extent are you knowledgeable about the topic it covered?

Pair 2. Before participating in this PD, to what extent did you practice behaviors or skills it taught?

After participating in this PD, to what extent do you practice behaviors or skills it taught?

Pair 3. Before participating in this PD, to what extent did you hold attitudes/beliefs it encouraged?

After participating in this PD, to what extent do you hold attitudes/beliefs it encouraged?

Aggregated pre-session scores averaged between 1.7 and 2.1, indicating that participants, overall, thought they had a moderate or slightly less than moderate level of knowledge, skill, and attitude/belief prior to engaging in the session. They assessed themselves just below the midpoint between the moderate and great levels after the session, indicating that participants, overall, thought they had grown professionally as a result of the experience.

Table 6. Overall Average Self-Scores for Extent of Knowledge, Practice, and Beliefs Before and After Professional Development

	Average	score
	Before PD	After PD
Knowledge about topic (n =		
3,400)	1.7	2.4
Practice of behaviors or		
skills (n = 3,278)	1.8	2.3
Held attitudes and beliefs		
(n = 3,304)	2.1	2.4

Note: 0 = not at all, 1 = to a small extent, 2 = to a moderate extent, 3 = to a great extent; responses marked not applicable were excluded from the analysis.

Source: WVBE PD Master Plan Participant Survey 2013-2014

To test the statistical significance of these findings, we ran a series of pairedsamples t tests using respondents' pre- and post-ratings. When statistically significant differences were found (i.e., p <.05), it is reasonable to say that the differences observed between participants' pre- and posttest results are not likely due to chance. That is, there is some systematic reason underlying the difference. This analysis, however, does not allow one to infer a cause for the difference. It merely describes the presence of a significant difference.

Significance testing revealed that

the results were significant at the p <.05 level for all but three of the 15 tests we ran—and the great majority of those tests were statistically significant at the p < .001 level (see Table B 8, page 40, in Appendix B).

One limitation of significance testing is that it tells us very little about the magnitude of any observed differences. We detect a difference, but cannot tell from the t test if the difference is meaningful in a practical sense. Calculating an effect size is one way to explain the magnitude of any statistically significant differences. In this study, we used Cohen's d as a measure of effect size. This statistic is often used in simple retrospective pre-test and posttest designs, although its interpretation is often debated in social sciences (see the Limitations of the Study section for more about this debate). The guidelines we used for interpreting the

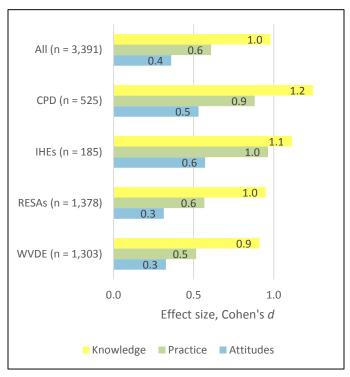

Table 7. Interpretation of Effect Size Estimates Used in this Study

Latiniates Osed in this atudy				
Value for Cohen's d	Interpretation			
Less than .4	Small effect			
.4 to .7	Moderate effect			
.8 or 1.1	Large effect			
1.2 and above	Very large effect			

meaning of the effect sizes in this study are found in Table 7.

Aggregating all results, respondents perceived a large impact on the extent of their knowledge as a result of attending the session, with moderate effects on their practice and attitudes/beliefs (Figure 8). This pattern held across

the provider groups with a couple of exceptions: CPD saw very large effects for knowledge

compared with the large effects seen by other groups, and large effects for practices compared with the moderate or small effects for the other groups. CPD and IHEs outperformed RESAs and WVDE in having a positive impact on knowledge, practice, and attitudes.

Figure 8. Reported Impact of PD on Knowledge, Practice, and Attitudes by Provider Group

See Table 7 for interpretation of these effect sizes. Data source: WVBE PD Master Plan Participant Survey 2014-2015

Discussion

Major findings for 2014–2015 include the following, arranged here by effectiveness, efficiency, and impact:

Effectiveness of the Master Plan

- The PD Master Plan included slightly fewer topics in 2014-2015 (434) than the previous year (479) and at 32,530 participants, attendance declined slightly overall compared with the previous year (33,196) This decline was due to lower participation for the Center for Professional Development (CPD), regional education agencies (RESAs), and the West Virginia Department of Education (WVDE); however, with the addition of three more institutions of higher education (IHE) for this year, attendance more than doubled at IHE-provided sessions to 1,545 participants.
- The PD Master Plan was implemented at levels comparable to previous years: overall 81% of sessions planned were delivered during the year.

- Regarding the effectiveness of providers in meeting the West Virginia Board of Education (WVBE) Standards for Professional Learning, overall, the standards that providers most often believed they had met were Standards 3 (Requires prioritizing, monitoring, and coordinating resources for educator learning), 5 (Integrates theories, research, and models of human learning into learning designs to achieve its intended outcomes), and 7 (Aligns its outcomes with educator performance and student curriculum standards). The two standards providers least often reported meeting were Standards 4 (Uses a variety of sources and types of student, educator, and system data to plan, assess, and evaluate professional learning) and 2 (Requires skillful leadership to develop capacity, advocate, and create support systems for professional learning).
- Regarding the extent to which providers' offerings reflected five research-based PD practices, overall, active learning was the research-based PD practice least often present, followed by sufficient duration/timespan. In both cases, RESAs and WVDE scored the lowest. Content focus had the highest rate of agreement, with IHEs topping the list.
- Providers' session reports seemed to confirm the findings from the participant survey about duration and timespan reported above. Of the 32,530 attendees reported by providers, about 20% (approximately 6,500) participated in PD lasting at least 30 hours; another 10% (approximately 3,250) had from 14 to 29 contact hours—durations shown by research to be the minimum needed to change teacher practice and impact student learning. The remaining 70% of participants attended sessions ranging from 1 to 13 hours.

Efficiency of the Master Plan

- The Legislature's call for decentralization of PD seems to be reflected in the trends for the four major providers in the PD Master Plan, with the WVDE decreasing its number of offerings and participants from the previous year. RESAs and CPD held fairly steady, while IHEs increased the number of institutions participating from two to five, and doubled the number of participants in IHE-sponsored sessions. Still, the WVDE continued to report the greatest number of both sessions planned and participants in attendance.
- The providers who exercised the greatest degree of collaboration were located in the WVDE, with CPD coming in second. Looking at individual providers, the top nine were in the WVDE.

Impact of the Master Plan

- While all four of the Board's Goals for Professional Learning received coverage, Goal
 2 ("Increase deep content knowledge and proficiency in designing and delivering standards-driven instruction and assessments") was the focus of about 72% of sessions and 60% of attendees.
- The participant surveys showed a high level of general agreement—at least 71%—that the sessions they attended had been helpful in meeting Goals 1–3; however only 57%

- of participants in Goal 4-aligned sessions found them helpful to them in advancing toward that goal.
- According to self-reports, the professional development had large effects on educators' knowledge of the PD topic, and moderate effects on their practice and their attitudes/beliefs.

Limitations of the Study

The response rate for the participant survey, 29.1%, was far lower than in previous years, when rates tended to range from 63% to 66%. The low response rate was due largely to the transition to a statewide Outlook Exchange system for email to the large majority of staff at schools, districts, and the WVDE during the first round of surveys, which led to two major impediments. First, many recipients had not fully transitioned to the new system so some were using their former email addresses instead of the new ones. Second, the server settings for Outlook considered email from SurveyMonkey—the system we used to send invitations and record the responses online—to be spam, so messages were blocked.

The participant survey conducted in November-December 2014 and May-June 2015 asked respondents to recall PD sessions they had participated in at some point in the past. In some cases, the sessions had taken place up to five months prior to the survey. For this reason, there is a possibility of temporal bias in survey participants' responses.

The use of a retrospective pre-test and posttest methodology to assess changes in knowledge, behavior and skills, and attitudes and beliefs poses some concerns. We used this methodology primarily because some researchers have argued that a phenomenon called response shift bias can occur when conducting traditional pre-test and posttest designs. Response-shift bias "occurs when a participant uses a different internal understanding of the construct being measured to complete the pretest and posttest" (Moore & Tananis, 2009, p. 190). Consider this in context of PD. Some respondents begin their involvement in professional development with a misconception that they are already well-versed in the content to be covered. When given a pre-test, they rate their own knowledge, behavior and skills, and attitudes and beliefs very positively. However, over the course of the professional development, as they develop a deeper understanding of the content being covered, they realize they did not know as much as they originally thought. As such, when presented with the post-test, their frame of reference has shifted and they could potentially rate their knowledge, behavior and skills, and attitudes and beliefs lower than they did on the pre-test. This can lead to problems in analyzing the impact of the PD. For this reason, some researchers advocate for using retrospective pre-test and posttest designs as we did in this study.

Despite this strength of the retrospective pre-test and posttest design, a recent research study conducted by Nimon, Zigarmi, and Allen (2011) found that using traditional pretest and posttest designs leads to less biased estimates of program effectiveness. The authors present a compelling case that presenting both pre- and posttest items simultaneously on a single survey is among the most biased design options available to researchers and can significantly inflate effect size estimates. The authors recommend traditional pre-test and posttest designs when possible and advocate for the implementation of a separate retrospective pre-test to allow researchers to determine the presence of any response-shift bias. This design

option, despite its strength, was not feasible in this study due to a mismatch between the scale of PD offerings in the state and available evaluation staffing resources. Therefore, we recommend cautious interpretation of our own estimates of effect size, as they may be somewhat inflated.

Recommendations

Based on these findings, we make the following recommendations.

In keeping with the West Virginia Board of Education's (WVBE) Standards for Professional Learning,

- Increase the use of a variety of sources and types of student, educator, and system data to plan, assess, and evaluate professional learning, and
- Increase focus on skillful leadership to develop capacity, advocate, and create support systems for professional learning.

With regard to the use of research-based professional development (PD) practices,

- Increase the use of active learning during PD sessions, and
- Provide sufficient duration (30 or more hours) and timespan (weeks or months) to allow participants opportunities to apply what they are learning.

Based on factors present in the larger context of PD in the state, we recommend that the WVBE and the West Virginia Department of Education

- Promote the Board's Standards for Professional Learning at the school and district level, so they will better guide educators' planning.
- Consider adoption of a model or standard for PD providers that aligns with and supports local learning communities working to adopt the Board's Standards for Professional Learning.
